

Abstract of the Disclosure:

A juicer is driven by an electric motor. The juicer is provided with a centrally-arranged, projecting, upwardly-tapering element, for the pressing of a fruit. The pressing  
5 element may be driven by a driveshaft, connected to the element. The driveshaft may be displaced in the axial direction. By pressing downwards on the element, the driveshaft is pressed against a switching means and the electric motor switched on thereby.
